

* Univariate, Bivariate & Multivariate Analysis

| Height _{cm} | Weight _{kg} | O/p |
|----------------------|----------------------|-------|
| 180 | 90 | Obese |
| 160 | 50 | Slim |
| 170 | 78 | Fit |
| 190 | 90 | Fit |
| 175 | 85 | Slim |

Multivariate

More than 3 features - Age, Height, Weight

We go with Pairplot in SeaBorn

Gives concept of Correlation -
A

Univariate Analysis

We ~~can't~~ maybe 100% correct. Overlap point will be there

We go for Bivariate/Multivariate

Bivariate Analysis

Like

If we are able to classify point properly, we can go for Logistic Regression

Logistic Regression :- Linear

If Overlapping Occurs, we go with Decision Tree / XGBoost / Random forest (Nonlinear) SVM / Adaboost / KNN Algo.

We touch your electricity everyday!

Z-Score:-

Gaussian Normal

$$Z_{\text{side}} = \frac{x_i - \mu}{\sigma}$$

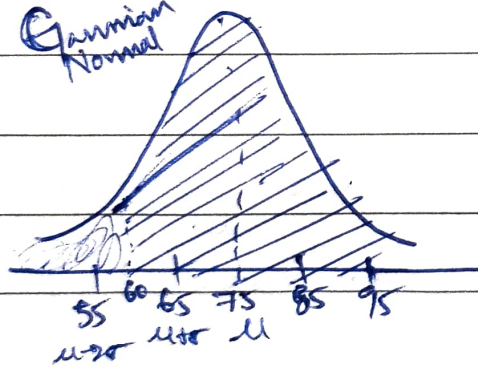

$$\mu = 75$$

$$\sigma = 10$$

$$P(x > 60)$$

Gaussian Normal

Z-score Table gives left hand side (Area of) ~~1.500~~

$$= -0.06681 \quad \text{i.e.} \quad 6.681\%$$

Remaining Area 93.319%
(Probability) $\approx 94\%$

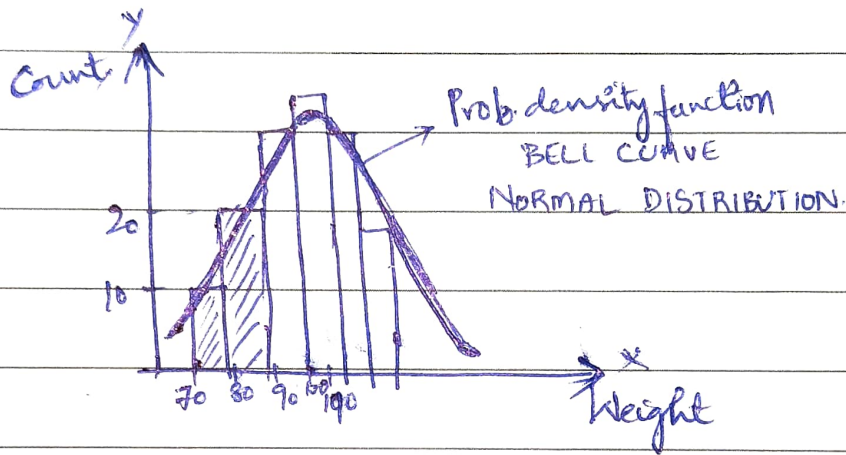

$$\frac{100.000}{6.681} = 93.319$$

Histograms:-

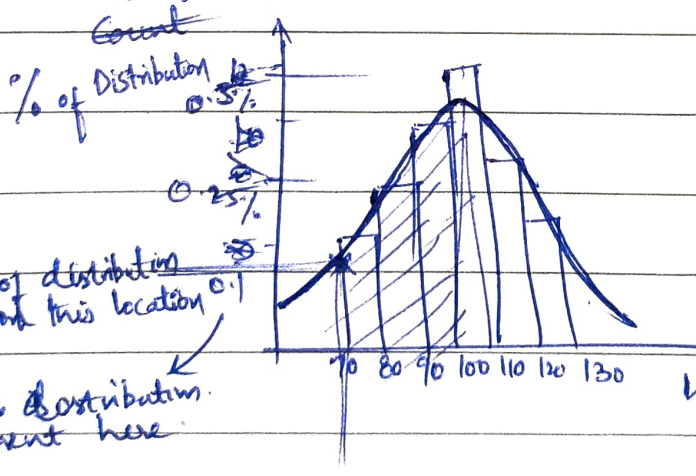

The given range

Given Information of How many No. of points in a given range (box)

ie \Rightarrow Build a Bargraph.

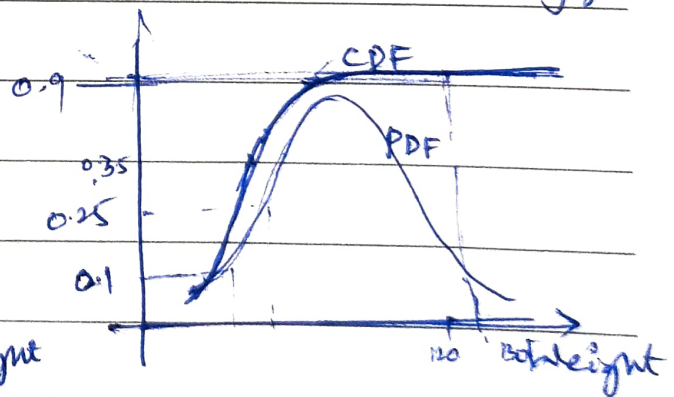

Prob. density function PDF

CDF

Cumulative ~~Density~~ Density function

0.1 to 0.25

90% < 130 kgs
